Private Cloud File Server

By Haomin Yu

Why this product

- Small and modular enough to build and evolve
- Realistic enough to analyze security risks
- Central server makes suspicious activity easier to observe
- Good fit for incident response and OE monitoring

Top 3 risks and why

1. Plaintext HTTP exposure
   - Credentials, session tokens, and file contents are exposed
2. File tampering and unrestricted upload
   - Files can be overwritten and uploads have limited validation
3. Denial of service via resource exhaustion
   - Repeated requests or excessive uploads can reduce availability
